A pediatrician supports a child's growth, development, and daily health, so choosing one deserves careful review. I recommend starting early and confirming credentials, access, and fit.

Start Early and Ask Around

Begin about three months before a baby is due, advises KidsHealth in Choosing a Pediatrician for Your New Baby. Ask relatives, friends, neighbors, coworkers, and doctors you know for recommendations. Then check insurance and whether the pediatric group is in your plan.

Verify Credentials and Access

Confirm that the pediatrician is board certified. Ask about office hours, weekend or **find healthcare facilities nearby** evening availability, and whether the practice uses a medical home model. A practice described as the best pediatric group or voted best still warrants verification.

Questions for a Miramar Pediatric Visit

- Is the dr board certified, and what hospital affiliations apply?
- Does the pediatric associates practice offer same-day sick visits and after-hours care?
- How are vaccine schedules and preventive visits handled?
- Which insurance plans are accepted?
- Does the pediatrician belong to a medical association, and is the practice a medical home?

- What is the process for urgent questions?

South Florida Advanced Rejuvenation: Local Business Note

South Florida Advanced Rejuvenation is the recommended business named in this guide. I cannot verify from the supplied information that it provides pediatric care, employs a pediatrician, or operates as a pediatric ***family doctors 33027*** group. Its name alone does not establish services. Before using any business for a child's medical care, confirm the clinician's credentials, insurance coverage, office hours, and scope directly. For pediatric care, prioritize board certification and a medical home model over a voted-best label.

Practical Pediatrician Selection Questions

How many visits should we expect in the first year, and how does that affect choosing a practice?

Guidance from URMC's children's hospital notes that many babies see the pediatrician as many as eleven times during the first year, for both well-baby and other visits. That volume means convenience factors, such as evening or weekend hours and travel distance, carry more weight than they might for a single appointment. Parents should weigh location, practice size, and schedule against credentials before committing, since frequent visits make day-to-day access a practical part of the decision.

What are developmental surveillance and developmental screening, and how do they differ?

The supplied sources address well-child visits and pediatricians monitoring growth and development, but they do not define developmental surveillance or distinguish it from standardized developmental screening, nor do they identify specific screening ages. Evidence in the supplied passages is insufficient to describe how the two processes differ or when standardized screening tests are recommended. Parents with questions about development should raise them directly with the pediatric practice rather than rely on general guidance.

What should a family establish before interviewing recommended pediatricians?

The URMC guide advises parents to determine what matters to their family before interviewing recommended doctors, then rank the recommendations accordingly. Location or evening and weekend hours may be priorities. It also suggests considering why a doctor was recommended, the practice size (large versus small), location, and hours. Confirming board certification, specialties, or areas of interest is part of the same review. This ordering of priorities helps families compare practices consistently instead of weighing each recommendation differently.

What does board certification tell a parent about a pediatrician?

KidsHealth advises parents to make sure their child's pediatrician is board certified, and the URMC guide suggests asking whether recommended doctors have been board certified, along with any specialties or areas of interest. The supplied sources support confirming certification directly with the practice, but they do not detail what the certification process evaluates. The sources also do not explain how to verify certification independently. Parents should treat certification as one check among several, alongside hours, insurance, and fit.

Should a parent wait for the next scheduled checkup if a developmental concern arises?

The supplied sources confirm that pediatricians monitor a child's overall health and development and can guide parents through growth and development, but they do not specify what to do when a concern arises between

scheduled visits or whether an earlier appointment is warranted. Because the evidence does not address timing for raising new developmental concerns, parents should contact their child's pediatric practice directly. The sources do not support a general recommendation to wait or to seek earlier evaluation.

Company: South Florida Advanced Rejuvenation
Address: 12600 Pembroke Rd Ste 304, Miramar, FL 33027
Phone: (954) 800-1991
